Course Overview

Store

Access

Manipulate

Learning Python is a journey.

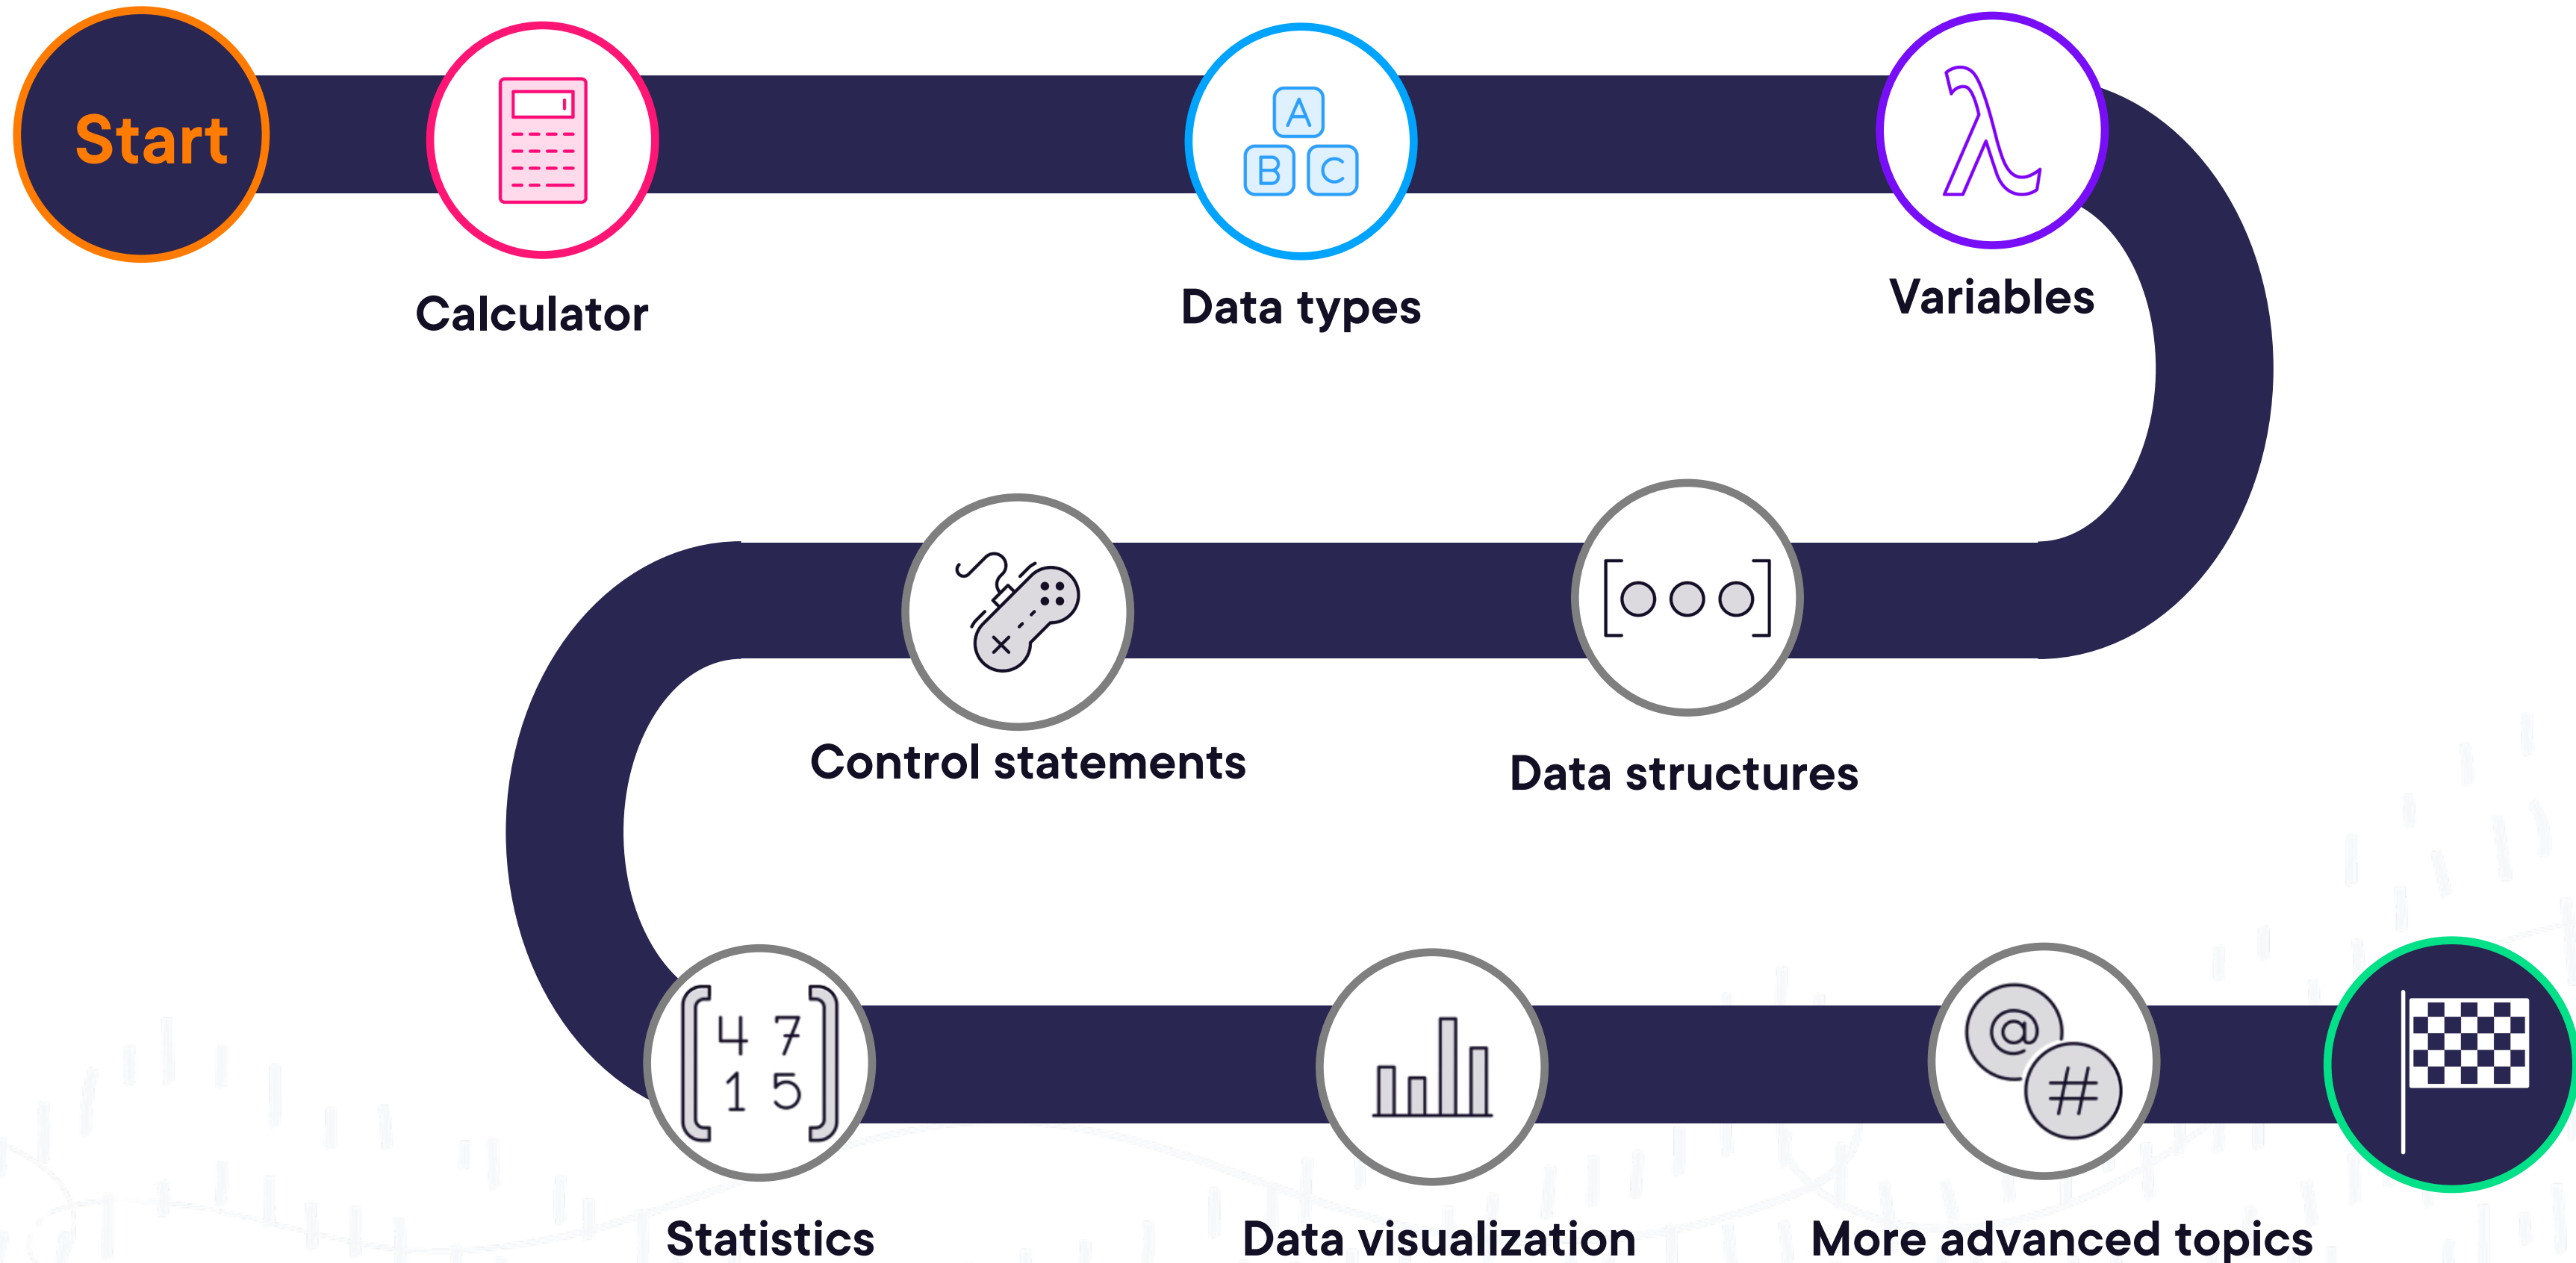

This is Tom! He works at Globomantics
- Increase supply chain efficiency

- Which products are bestsellers?
- Which products are low in stock?
- Which products need discounting based on their stocks?

Learning Python

Storing Information

```
product = "apple"  
quantity = 2  
price = 0.9
```

Storing Information

```
product = "apple"  
quantity = 2  
price = 0.9
```

```
product2 = "orange"  
quantity2 = 4  
price2 = 1.2
```

```
product3 = "lemon"  
quantity3 = 6  
price3 = 0.4
```

Data structures store a collection of related data so that we can access the data efficiently.

List Anatomy

Lists

```
products = [ "mango", "orange", "lemon" ]
```

Lists

```
products = [ "mango", "orange", "lemon" ]
```

Lists

```
products = [ “mango”, “orange”, “lemon” ]
```

Lists

```
products = [ "mango", "orange", "lemon" ]
```

Lists

products		
mango	orange	lemon

Lists

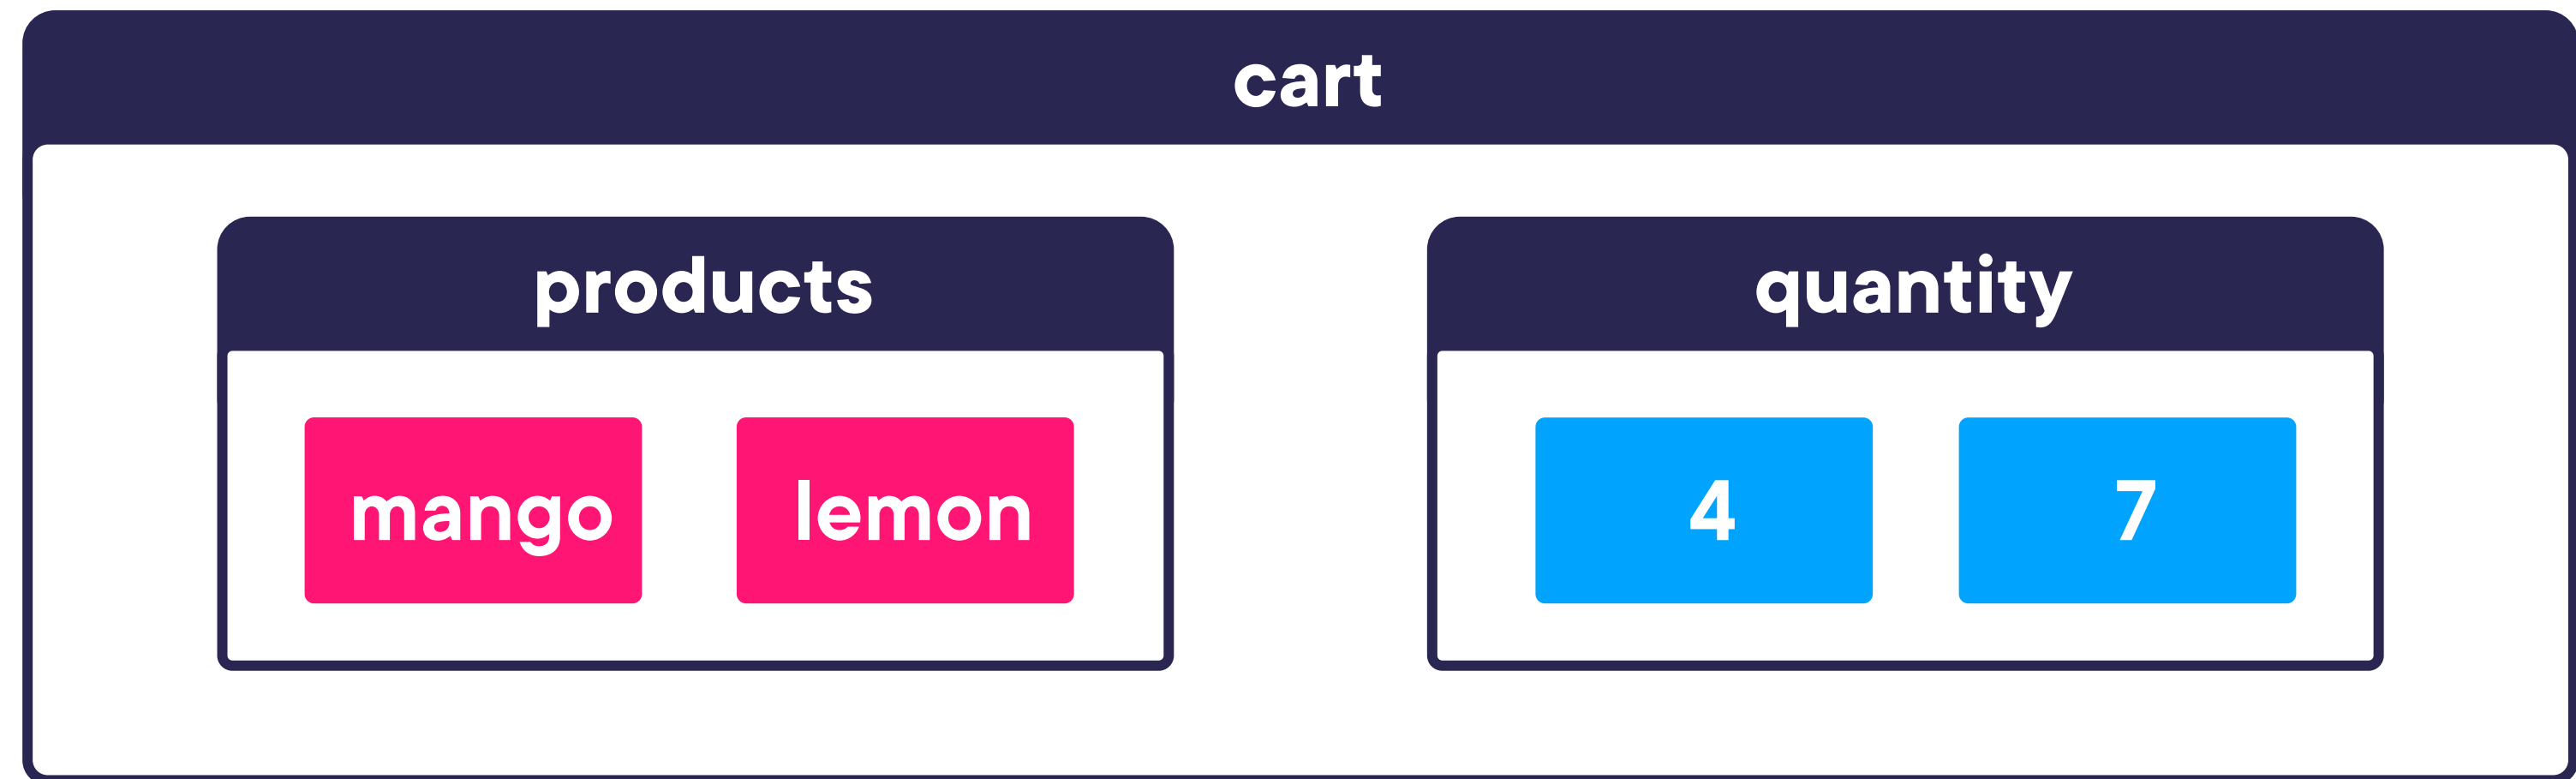

quantity		
4	3	7

Manipulating Lists

Manipulating Lists

append

remove

Manipulating Lists

Methods

append

remove

Manipulating Lists

Methods

append

remove

insert

extend

pop

clear

{y, x}

Methods

A method is a function built in into a specific data structure.

Methods

```
# Creating a list  
products = ['orange', 'mango']
```

```
# Calling the len function  
len(products)
```

```
# Calling the append method  
products.append('banana')
```

Methods

Name

Parameters

Output

Demo

Use methods

- Add elements
- Remove elements
