

Reusing Code with Functions

Mateo Prigl
Software Developer

```
def say_hello():  
    print("Hello")
```

```
say_hello() # Output: Hello
```

◀ Function definition includes the **def keyword**, followed by the function's name and function's body

◀ To call that function, you can just use the function's name with parentheses next to it

Special Function Parameters

`*args`

`**kwargs`

Types of Objects in Python

Mutable

Immutable
